MODULE 08 · 3 HOURS

Enterprise Integration & Automation

Extending intelligent agents into Power Automate, Azure Functions, and event-driven enterprise workflows.

AGENTIC AI · ENTERPRISE TRACK

POWER AUTOMATE · AZURE FUNCTIONS · APIs

Three pillars of enterprise automation

How agents move from sandbox prototypes into production-grade enterprise workflows.

01

ORCHESTRATION LAYER

Power Automate Advanced Orchestration

- Multi-step cloud flows with conditional branching
- Approval chains & human-in-the-loop steps
- Connectors for M365, Dataverse, SharePoint
- Error handling & retry policies

02

COMPUTE & APIS

Azure Functions + APIs Integration

- Serverless functions (HTTP, Timer, Queue triggers)
- REST API design & secure exposure via APIM
- Managed identity & Key Vault for secrets
- Bindings to Storage, Cosmos DB, Service Bus

03

REACTIVE ARCHITECTURE

Event-Driven Pipelines

- Event Grid & Service Bus for decoupling
- Pub/sub patterns for agent-to-system signals
- Logic Apps for long-running orchestrations
- Observability with App Insights & tracing

Build it. Ship it. Measure the lift.

Two practical labs that turn the three pillars into a working enterprise automation system.

HANDS-ON LABS

Two integrated builds, end-to-end

01 **Trigger workflows via agents**

Wire an AI agent to a Power Automate flow. The agent calls a custom connector that kicks off an approval chain, posts to Teams, and writes to SharePoint — all from a single natural-language request.

02 **API-driven automation system**

Build an Azure Function exposing REST endpoints, secured by APIM. Event Grid emits domain events that fan out to downstream Logic Apps, completing a closed-loop agentic pipeline.

OUTCOME

Extend agents into enterprise workflows

Learners leave able to plug an AI agent into the M365 + Azure stack — turning conversational intent into orchestrated, observable, production-ready automation.
